

Qualys WAS 4.4 New Features

As a follow-up to our recent major release WAS 4.3, we have added a few new features, tweaks and clarifications in WAS 4.4 to allow further customizations of scans. Customers can also now receive clearer and enhanced feedback on the behavior and coverage of their scans. This will also allow customers to continue to deliver targeted web application security metrics to all the stakeholders while ensuring a successful web application security program meets the protection of all organizational demands.

Feature highlights include:

- **Report Templates - We have added a run action in preview button**
- **We have removed non-expiring reports for the WAS purge feature**
- **We now publish information on the user who canceled a scan**
- **Clarification and support for server error thresholds before stopping a scan**
- **WAS Scan Emails - Include Qualys username in the recipients email**

Report Templates - We have added a run action in preview button

The report template datalist provides a quick run action, which allows users to run a report using this template. This would be the most logical action for this object, but this action was somewhat hidden as you needed to open the Actions menu to see this. Therefore, we have made the report template run action more visible to the user, so that they can more easily and visibly launch reports.

The screenshot displays the 'Report Management' interface in Qualys WAS 4.4. The top navigation bar includes 'Dashboard', 'Web Applications', 'Scans', 'Burp', 'Reports', 'Configuration', and 'KnowledgeBase'. The main content area is titled 'Report Management' and has tabs for 'Reports', 'Schedules', 'Templates', and 'Catalog report'. A search bar and 'Search' button are present. Below the search bar is a 'Filter Results' section with 'Tags' and 'Type' filters. The 'Type' filter is set to 'Catalog Report'. A table lists report templates with columns for 'Name', 'Type', 'Owner', and 'Last Update Date'. The first row, 'C #21', is highlighted in yellow. Below the table is a 'Preview' section for the selected template 'C #21', showing 'Last updated by Axel Tessier (quays_at1) | 02 Oct 2015 11:38PM GMT+0200'. The preview details include 'Type: Catalog Report', 'Tags: -', 'No of Runs: 1', and 'Last Run Date: 02 Oct 2015 11:38PM GMT+0200'. A 'Run Report' button is visible in the bottom right of the preview section.

Name	Type	Owner	Last Update Date
C #21	Catalog Report	Axel Tessier (quays_at1)	02 Oct 2015
S	Scorecard Report	Axel Tessier (quays_at1)	14 Sep 2015
C	Catalog Report	Axel Tessier (quays_at1)	02 Oct 2015
Catalog report (default)	Catalog Report	System	02 Oct 2015
Scorecard report (default)	Scorecard Report	System	22 Sep 2015
Scan Report (default)	Scan Report	System	12 May 2015
Web Application Report (default)	Web Application Report	System	14 Sep 2015

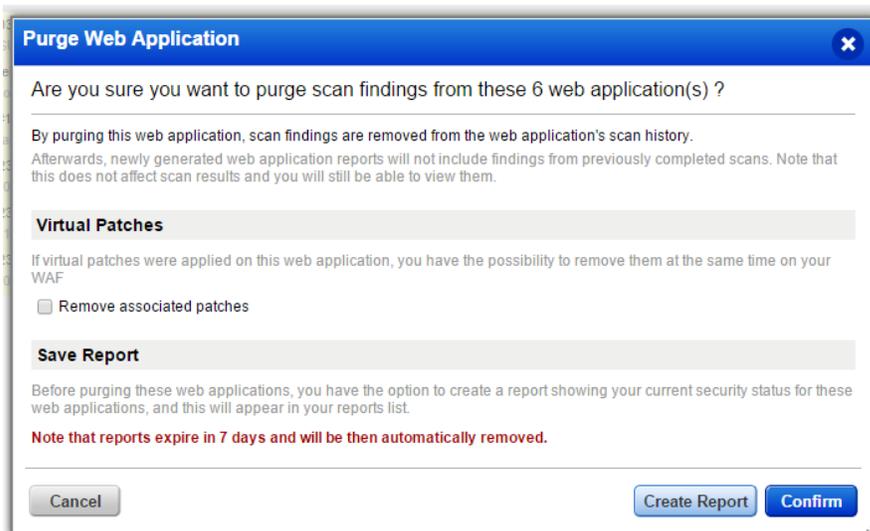

We have removed non-expiring reports for the WAS purge feature

With a previous reporting feature released with WAS 3.0 we allowed users to create reports of their web applications before they deleted or purged them.

These particular reports were unique, whereas all other reports generated in the application expired after a specific number of days. The reports however, did not. This logic was to allow users to keep a history of all their web applications. This led to unwanted and excessive data storage.

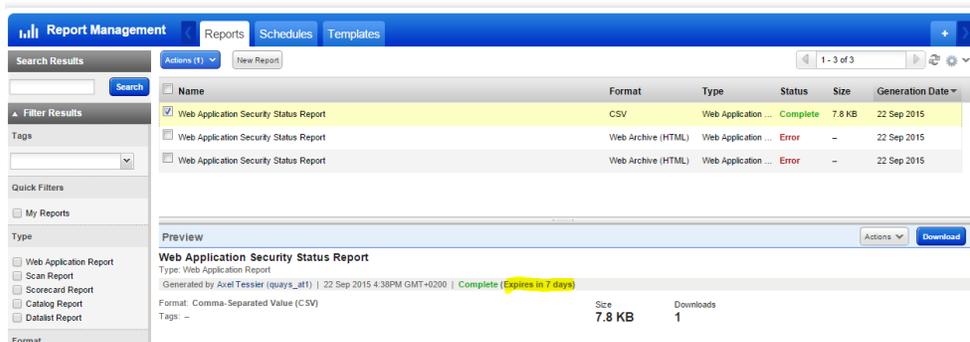

Web Application Purge Confirmation Dialog

The purge confirmation dialog has been updated to add a note that the report to be generated will expire in a specific number of days; the number being defined by the customer's WAS module setting Report Life Time. Please note, by default this is set to 7 days.

Report Generation

The generation of the report remains the same. The only change is that reports are no longer marked as non-expiring. A look at the preview panel confirms that the report will indeed expire.

The screenshot shows the 'Report Management' interface. On the left, there are search and filter options. The main area displays a table of reports:

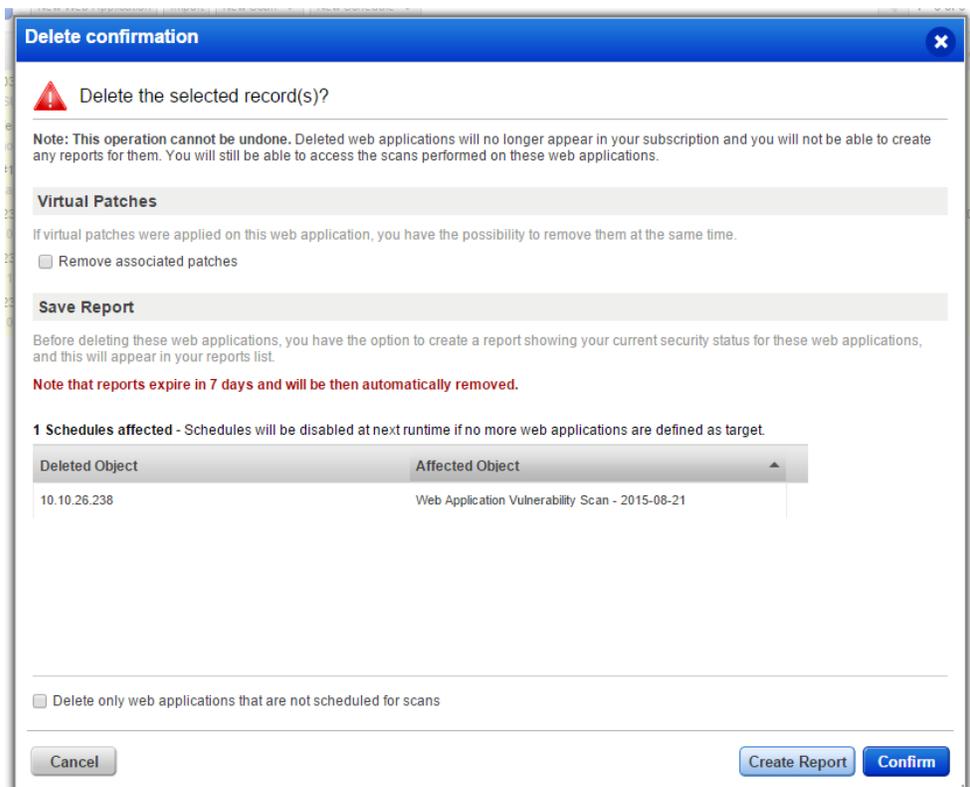

Name	Format	Type	Status	Size	Generation Date
<input checked="" type="checkbox"/> Web Application Security Status Report	CSV	Web Application ...	Complete	7.8 KB	22 Sep 2015
<input type="checkbox"/> Web Application Security Status Report	Web Archive (HTML)	Web Application ...	Error	-	22 Sep 2015
<input type="checkbox"/> Web Application Security Status Report	Web Archive (HTML)	Web Application ...	Error	-	22 Sep 2015

Below the table is a 'Preview' section for the selected report:

Web Application Security Status Report
Type: Web Application Report
Generated by Axel Tessier (quays_at1) | 22 Sep 2015 4:38PM GMT+0200 | Complete Expires in 7 days
Format: Comma-Separated Value (CSV) | Size: 7.8 KB | Downloads: 1

Web Application Delete Confirmation Dialog

The same changes apply for this dialog, where the layout has been updated to better distinguish the sections. Also a note has been added to notify users that the report to be generated will expire.

The 'Delete confirmation' dialog box contains the following sections:

- Delete the selected record(s)?** (Warning icon)
- Note:** This operation cannot be undone. Deleted web applications will no longer appear in your subscription and you will not be able to create any reports for them. You will still be able to access the scans performed on these web applications.
- Virtual Patches:** If virtual patches were applied on this web application, you have the possibility to remove them at the same time.
 Remove associated patches
- Save Report:** Before deleting these web applications, you have the option to create a report showing your current security status for these web applications, and this will appear in your reports list.
Note that reports expire in 7 days and will be then automatically removed.
- 1 Schedules affected - Schedules will be disabled at next runtime if no more web applications are defined as target.**
- Table of affected objects:

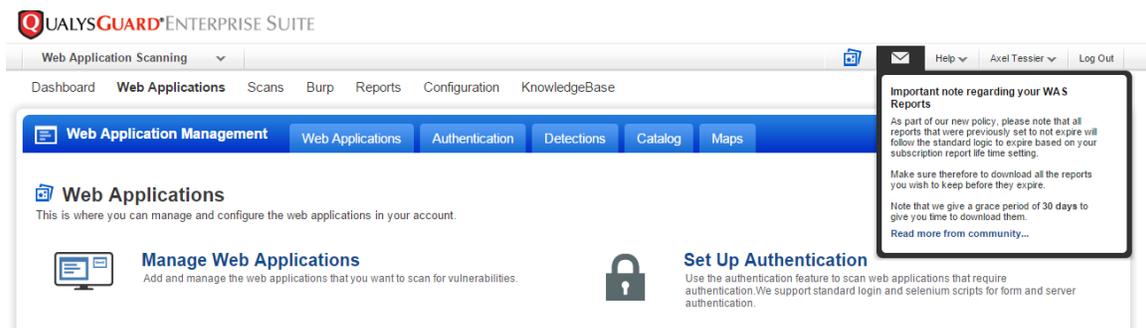

Deleted Object	Affected Object
10.10.26.238	Web Application Vulnerability Scan - 2015-08-21
- Delete only web applications that are not scheduled for scans
- Buttons: Cancel, Create Report, Confirm

Existing Non-Expiring Reports

This feature will impact existing reports that do not expire, by updating their status to make them expire 30 days after the release of this feature in production.

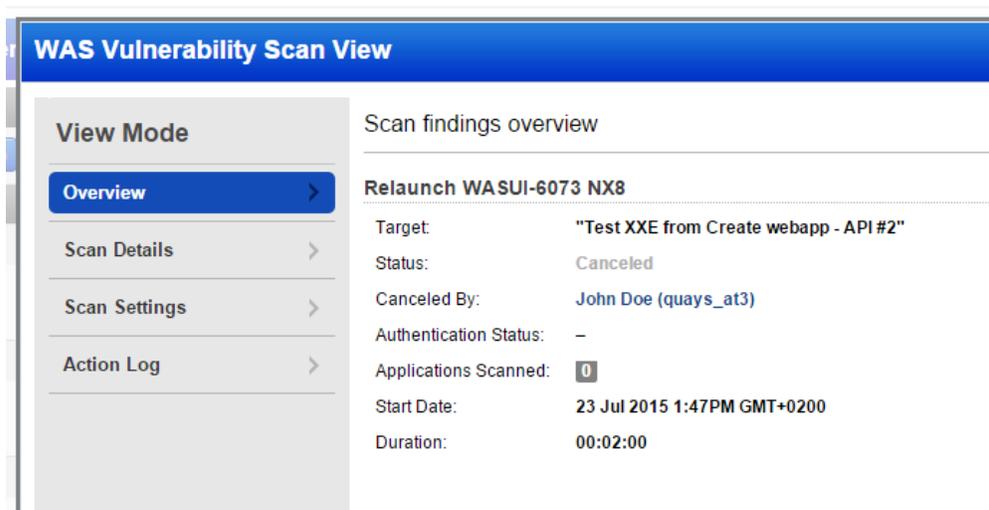

Notification

To make sure that all users may see this information, a notification will be added for 30 days after the release to explain that the reports that did not have an expiration date will now expire in 30 days, and that users should make sure to download them if they wish to keep them.

We now publish information on the user who canceled a scan

When a scan is canceled, we previously displayed the status as canceled and we only provided in the action log, the information on who canceled the scan. But we did not display this information when viewing the scan information in main scan dialog panel. This has now been changed to reflect the user who canceled the scan.

Clarification and support for server error thresholds before stopping a scan

Web applications can return different kinds of server side error or error indicators during a WAS scan. Some of these are a sign of the server possibly getting overloaded (or unresponsive) due to the scan behavior or an alternate condition.

Customers have had different expectations about how our WAS engine should react to these server errors. Our clients have asked us to provide better controls on whether to stop scan on such errors and customize a threshold for such conditions. Now, two new options are now provided to the end user:

- Stop on timeout errors more than 20 (customizable)
- Stop on unexpected errors more than 48 (customizable)

The screenshot shows a web application window titled "Option Profile Edit: POR-4394 - Test 1". The window has a blue header with "Turn help tips: On | Off" and "Launch help" with a close button. On the left, there is a sidebar with "Edit Mode" and several menu items: "Profile Details", "Scan Parameters" (highlighted in blue), "Search Criteria", "Comments", and "Action Log". The main content area is titled "Please define how the scan will perform" and contains two sections: "General Settings" and "Behavior Settings".

General Settings (marked with a red asterisk for required fields):

- Form Submission*: Post & Get (dropdown menu)
- Maximum crawl requests (the total number of links and forms to follow)*: 300 (text input)
- User Agent: Example: Mozilla/4.04 (X11; I; SunOS 5.4 sun4m) (text input)
- Request Parameter Set*: Initial Parameters (dropdown menu with "View" and "Create" links)
- Document Type: Ignore common binary files based on file extensions.

Behavior Settings

These settings define the threshold to be reached before stopping the scan. If you deactivate these settings, the scan will keep running no matter how many errors it will find.

- Timeout Error Threshold: 22 (text input)
- Unexpected Error Threshold: 50 (text input)

At the bottom, there are "Cancel", "Save As..", and "Save" buttons. The status bar at the very bottom shows "Parameter Set: Initial Parameters" and "Mach Automation CHN-1".

WAS Scan Emails - Include Qualys username in the recipients email

When sending WAS scan emails, we now show each recipient's name and username from their Qualys account, depending on if this data can be extracted.

When sending a scan completion email, the list of recipients will be updated to display along with the email address, the account name, using format

email address <account name>

The account name value will depend on if one or more accounts are found for the same email address:

If only one account is found, the account name will be "user first name, user last name, username".

Ex: John Doe (quays_jd01)

If more than one account is found for an email address, the account name value will consist of just the username of the accounts, separated by comma.

Ex: quays_ty5,quays_tq58,quays_ty4
